

DNA tower

"The helical form becomes a symbol of the balance between nature and man. The helical form of DNA not only reminds us of the origin of life, it is the symbol of dynamism, harmony, integration between man and the environment. The project is designed according to the basic rules of bioclimatic, taking into account the solar cycle, which winds blow and in which direction, which endemic plants grow on roofs and terraces. All this will make it possible to exploit renewable energy sources, such as wind, solar and geothermal energy, and use biomass to produce electricity, heat and refreshment in the summer months. From the structural point of view the helicoidal shape will allow each resident (the tower will be used both for office and residential use) to enjoy a unique view thanks to the large terraces, suspended gardens and green walls."
